Update VMWare Horizon Client software at home

Prerequisites

- Save your work before you update Horizon Client. The update might initiate a system reboot.
- Verify that you can log in as an administrator on the client system.

To verify if the online update feature is enabled, follow these steps;

- Log in to the client system (your home computer) as an administrator.
- Start Horizon Client and click Software Updates.

Option	Action
Before you connect to a server	Click Options > Software Updates.
After you connect to a server	Click Help > Software Updates.

- To check for available updates, click Check for Updates.
- Horizon Client indicates whether an update is available.

If the Enable update notifications check box is selected (the default), Horizon Client detects available updates. To indicate that a new Horizon Client version is available, a red dot appears on the Options menu (before you connect to a server) or on the Help button (after you connect to a server). You can disable automatic update detection by deselecting this check box.

- To begin the update process if an update is available, click Download and Install.
- To install the update after Horizon Client downloads the update, click OK.
- The Horizon Client interactive installation wizard opens.
